

PROJECTS

TYPE renovation LOCATION cogollo del cengio, italy ARCHITECT stefano larotonda WITH manuel bellagamba FOR the municipality of cogollo KEY ELEMENTS this intervention is the set of three hypogeous spaces with different characters. the first is the long access corridor, the second is a sort of ambulatory, and the third space is in the main one and it's part below the square. its cylindrical shape is surmounted by a large dome closing in an eyepiece which was used for ice refueling. the project proposal seeks to preserve the main space in its integrity without removing its intrinsic force, and focusing the intervention on the path of arrival to that space. this glacier becomes the exhibition area with a large circular bench serving as a table for sculptures. steps and flooring are designed in cement-based materials with inert materials to ensure good structural support and make clear the epochs of the different interventions in a different way to the existing.
